

The PySpark build may be filling a temporary/
build location.

Do this first

Run these one at a time:

```
df -h /
```

```
df -h /tmp
```

```
df -i /
```

```
du -sh ~/.cache/pip 2>/dev/null
```

Also clean the failed PySpark build

Since you're currently in:

```
rm -rf build
```

```
pip cache purge
```

```
df -h /
```

```
mkdir -p ~/tmp
```

```
TMPDIR=$HOME/tmp pip install pyspark
```

This may take several minutes. You'll see lots of lines such as:

```
Collecting pyspark
```

```
Downloading...
```

```
Building wheel...
```

```
Installing collected packages...
```

Only after installation finishes

```
python -c "import pyspark; print(pyspark.version)"
```
